Summary

I am a security engineer and researcher with a strong interest in uncovering inter-domain security threats in emerging technologies, including AI safety/security, IoT systems, mobile/cellular networks, and cyber-physical systems. Beyond device-level vulnerabilities, I am eager to explore how security issues affect business operations and user privacy through service architectures, business logic, profit models, and data privacy for both customers and companies. My goal is to engage deeply in security engineering, devising practical solutions to mitigate risks effectively.

With the rising significance of AI, my current focus areas include:

- Leveraging AI for Security: As a Postdoctoral Fellow at Georgia Tech, I am participating in the final round of DARPA's AIxCC competition, where I develop AI agents that autonomously analyze source code, identify vulnerabilities, and generate exploits.
- Securing AI-integrated Systems: As a specially contracted employee at Samsung Security Center, I worked on securing enterprise AI-driven infrastructures and on-device AI implementations.

I believe teamwork is essential to addressing security challenges. I thrive in cross-functional environments, sharing insights and working closely with diverse teams to strengthen security postures. At Samsung (2022—2024), I collaborated with cross-functional teams to address security threats — ranging from device-level vulnerabilities, such as Android application and IoT devices, to broader risks in customer and enterprise service architectures, including abuse scenarios and trusted third-party issues. With strong communication skills, I have won multiple awards in hacking contests, qualified for the DEFCON finals five times, and led the KAIST hacking team in organizing CTFs such as Samsung CTF '17 and '18.

As a security researcher (2014—2022), I earned my Ph.D. in Electrical Engineering from KAIST, under the advisement of Yongdae Kim. My research has:

- Uncovered new threats in emerging technologies, including IoT devices, drones, cellular networks, and blockchain.
- Challenged long-standing security assumptions in cellular networks and binary code similarity analysis.
- Sharpened hands-on engineering skills in firmware emulation and analysis, as well as smartphone baseband firmware analysis.

My work has resulted in nine publications in top-tier venues (USENIX Security, CCS, NDSS, TSE, TMC), seven registered patents, 17 industrial and governmental projects, and multiple invited talks at leading security conferences, reflecting my dedication to advancing security research and engineering.
